02/01/2018

Computer Graphics

2D on screen

#include <graphics.h>

Primitives: Line, Circle

LINE:

$$y = mx + c$$

for $m > 1$

y changes more as compared to x.

$$x = y/m - c/m$$

$$x_i = \frac{y_i}{m} - \frac{c}{m}$$

$$x_{i+1} = \frac{y_{i+1}}{m} - \frac{c}{m} \qquad (y_{i+1} = y_i + 1)$$

$$x_{i+1} = \frac{y_i}{m} - \frac{c}{m} + \frac{1}{m}$$

$$\boxed{x_i + 1 = x_i + \frac{1}{m}} \qquad [y_{i+1} = y_i + 1]$$

for $m < 1$

Changes in x are more than those in y

$y = mx + c$

$y_i = mx_i + c$

$y_{i+1} = mx_{i+1} + c$ $\quad (x_{i+1} = x_i + 1)$

$y_i + 1 = mx_i + c + m$

$\boxed{y_i + 1 = y_i + m}$ $\quad [x_{i+1} = x_i + 1]$

<u>Algorithm to draw a line:</u>

```
mline (x1, x2, y1, y2) {

    dy = y2 - y1;
    dx = x2 - x1;
    m = dy/dx
    if (abs(dy) < abs(dx)) {
        x = x1, y = y1;
        display (x, y);
        while (x < x2) {
            x++;
            y+= m;
            display(x, y);
        }
    }
    if (abs(dy) ≥ abs(dx)) {
        x = x1, y = y1;
        display(x, y);
        while (y <= y2) {
```

```
    y++;
    x+ = 1/m;
    display(x, y)
  }
}
```

Another approach of line (Midpoint Approach)

$ax + by + c = f(x, y)$

iff $f(x, y) = 0$, then point lies on the line

$$f(x_p, y_p) = ax_p + by_p + c$$

$$f(m) = a(x_p + 1) + b(y_p + 1/2) + c$$

deciding value

Case 1: if $f(m) = 0$, then lies on the line

Case 2: $f(m) > 0$

Case 3: $f(m) < 0$

04/01/2018

Primitive Drawing
→ Mathematical equation

Line

$y = mx + c$

m: <0 >0 $=0$ $=1$ $=\infty$

Smallest unit: Pixel

Inputs: ~~x_1, x_2, y~~ $x_1, y_1 ; x_2, y_2$

```
dx = x2 - x1;
dy = y2 - y1;
x = x1 , y = y1;
putpixel ( x, y, WHITE);
while ( x <= x2)
{
    y+ = m;
    x++;
    put pixel ( x, y, WHITE);
}
```

→ floating pt & floating pt. computation takes more time.

MidPoint Approach:

To avoid floating pt. computation

Screen is in the form of a grid

Every intersection is a pixel location

$\because$ $m<1$, $dy < dx$ $\Rightarrow$ x is incremented & accordingly y is computed (major movement in x).

$$f(x,y) = ax + by + c$$

<0 $=0$ >0

$$f(M) = f(x_p+1, y_p + 1/2)$$

d (decision) $= f(M) = a(x_p+1) + b(y_p+1/2) + c$

keeps on updating depending on value of $f(M)$

if $d<0$
selection is E

$$f(M_E) = f(x_p+2, y_p+1/2)$$

$$d_{new} = a(x_p+2) + b(y_p+1/2) + c$$

$\Delta E = f(M_{E}) - f(M)$

$\Delta E = d_{new} - d$

$= a$

$y = mx + c$

$\frac{dy}{dx}$ Replace m with dy/dx.

$dx \cdot y = dy \cdot x + dx \cdot c$

$f(x, y) = (dy)\, x - dx \cdot y + dx \cdot c = 0$

$\Downarrow$

(a)

$\Rightarrow \Delta E = a = dy$

else if $d > 0$

selection is (NE)

$f(M_{NE}) = f(x_p + 2, y_p + 3/2)$

$d_{new} = a(x_p + 2) + b(y_p + 3/2) + c$

$\Delta NE = d_{new} - d$

$\Delta NE = f(M_{NE}) - f(M)$

$\Delta NE = a + b$

$\Rightarrow \underline{a + b = dy - dx}$

$d = f(x_p + 1, y_p + 1/2)$

$= ax_p + a + by_p + b/2 + c$

$= \underbrace{ax_p + by_p + c}_{\Downarrow} + a + b/2$

This pt. is on line ; so it will be 0.

$\boxed{d_{in} = a + b/2}$.

To remove 1/2 from b/2, multiply it with a scalar qty, that is, 2.

$f(x, y) = 2(ax + by + c)$

$d_{in} = 2a + b = \underline{2dy - dx}$

If $d < 0$, $\Delta E = 2dy = 2a$.

else $\Delta NE = 2(dy - dx)$
$= 2(a + b)$

~~$d = f(x_p + 1,$~~

Changes in previous code:

```
d = ~~2*(dy-dx);~~  2*dy - dx;
while (x <= x2)
{
    if d<0
        d+ = 2*dy;
    else
        {d+ = 2*(dy-dx);
         y++;
        }

    x++;
    putpixel (x, y, WHITE);
}
```

Example:

$x_1 = 10$
$y_1 = 10$
$x_2 = 20$
$y_2 = 18$

$m < 1$

~~dy = 8~~
~~dx = 10~~
$x = 10$ (x_1)
$y = 10$ (y_1)

Check Table

x_1	y_1	d
10	10	6
11	11	2
12	12	-2
13	13	14

Complete the rest of

For $m > 1$:

At (x_p, y_p):

$$f(x_p, y_p) = 2(ax_p + by_p + c)$$

$$d = f(M) = f(x_p + 1/2 + y_p + 1)$$

$$d = 2a(x_p + 1/2) + 2b(y_p + 1) + 2c$$

if $d < 0$

selection is (N)

$f(M_{(N)}) = f(x_p + 1/2, y_p + 2)$

$d_{new} = 2a(x_p + 1/2) + 2b(y_p + 2) + 2c$

$\Delta N = f(M_{(N)}) - f(M)$

$\Delta N = d_{new} - d$

$\Delta N = 2b = -2dx$

else if $d > 0$

selection is (NE)

$f(M_{(NE)}) = f(x_p + 3/2, y_p + 2)$

$d_{new} = 2a(x_p + 3/2) + 2b(y_p + 2) + 2c$

$\Delta NE = f(M_{(NE)}) - f(M)$

$\Delta NE = d_{new} - d$

$\Delta NE = 2a + 2b = 2(dy - dx)$

$d = f(x_p + 1/2, y_p + 1)$

$d = ax_p + a/2 + by_p + b + c$

$d = \underbrace{ax_p + by_p + c}_{=0} + a/2 + b$

$$d = a/2 + b$$

$$f(x,y) = 2(ax + by + c)$$

$$d_{in} = a + 2b = dy - 2dx$$

2	8	-1
3	7	-6
4	7	3
5	6	2
6	5	5

* Rather ~~for~~ going for 1st diff, we go for 2nd diff. becoz time taken for multiplication is more than ~~arithmetic~~ addition so arithmetic computation time can be reduced.

Pre requisites for 2nd differential:

At (x_p, y_p), 1st differential are:

$\Delta E = 2x_p + 3$

$\Delta SE = 2(x_p - y_p) + 5$

If $d < 0$

Selection is (E)

At (E): $(x_p + 1, y_p)$

$$\Delta E_{new} = 2x_p + 5$$

$$\Delta SE_{new} = 2(x_p - y_p) + 7$$

$$\boxed{\Delta^2 E^{(E)}_{(\Delta E_{new} - \Delta E)} = 2}$$ → for the selection of E

$$\boxed{\Delta^2 SE^{(E)}_{(\Delta SE_{new} - \Delta SE)} = 2}$$

else

selection is (SE)

At (SE) : $(x_p + 1, y_p - 1)$

$$\Delta E_{new} = 2x_p + 5$$

$$\Delta SE_{new} = 2(x_p - y_p) + 9$$

$$\boxed{\Delta^2 E^{(SE)} = 2}$$

$$\boxed{\Delta^2 SE^{(SE)} = 4}$$

Now, we have to initialise ΔE & ΔSE.

$d = 1 - R$
$\Delta E = 3$
$\Delta SE = 5 - 2R$ } Starting from $(0, R)$

Changes in previous code:

```
x = 0;
y = R;
deltaE = 3;
deltaSE = 5-2R;

circle symmetry (x, y);
while (x <= y)        → for 1st octant only
{
  if d<0
  {
      d+ = deltaE;
      deltaE+ = 2;
      deltaSE+ = 2;
  }

  else
  {
      d+ = deltaSE;
      deltaE+ = 2;
      deltaSE+ = 4;   y--;
  }
  x++;
  circle symmetry (x,y);
}
```

$R = 8$

x	y	d	dettaE	dettaSE
0	6	-7	3	-11
1	8	-4	5	-9
2	8	1	7	-7
3	7	-6	9	-3
4	7	3	11	-1
5	6	2	13	3
6	5	5	15	7

$grad(E) = \frac{\partial f}{\partial x} i + \frac{\partial f}{\partial y} j$. If $\partial f / dx = \partial f / dy$ then $|dy/dx| = 1$

- Difference in measurable qty. for a primitive should either be +ve or -ve

15/01/2018

Bresenham's Approach

- → Find a measurable qty
- → Difference in measurable qty for decision making.

LINE:

$m < 1$

At (x_p, y_p): $y_p = m x_p + c$

→ For every primitive, there is a unique mathematical equation & unique measurable quantity.

→ Identify a measurable qty. for every primitive

→ Here, measurable qty is a distance.

At $(x_p + 1)$: $y = m(x_p + 1) + c$

$$d_1 = y - y_p \quad \text{—①}$$
$$d_2 = (y_p + 1) - y \quad \text{—②}$$

$$d = d_1 - d_2 = 2y - y_p - y_p - 1$$

$$\boxed{d = 2[m(x_p+1) + c] - 2y_p - 1}$$

→ floating pt. computation (because of m)

$$d \cdot \Delta x = 2[\Delta y(x_p+1) + c \cdot \Delta x] - 2y_p \Delta x - \Delta x$$

$$d = 2\Delta y x_p + 2\Delta y - 2y_p \Delta x - \Delta x + 2c\Delta x$$

$$d = 2\Delta y x_p - 2\Delta x y_p + \underbrace{[2\Delta y - \Delta x - 2c.\Delta x]}_{\text{constant}}$$

$$\boxed{d = 2\Delta y x_p - 2\Delta x y_p + C} \quad \text{—(3)}$$

if $d < 0$

selection is (E)

$$d_{new} = 2\Delta y (x_p + 1) - 2\Delta x y_p + C$$

$$\boxed{\Delta E = d_{new} - d = 2\Delta y}$$

else

selection is (NE)

$$d_{new} = 2\Delta y (x_p + 1) - 2\Delta x (y_p + 1) + C$$

$$\boxed{\Delta NE = d_{new} - d = 2(\Delta y - \Delta x)}$$

<u>For d_{in}</u> :

$$d = 2[m(x_p + 1) + c] - 2y_p - 1$$

$$d = 2\Delta x[m x_p - \cancelto{0}{y_p} + c] + (2\Delta y - \Delta x)$$

$$\boxed{d_{in} = 2\Delta y - \Delta x}$$

For $m > 1$:

$$d_1 = \cancel{x} - (x_p + 1) - x$$

$$d_2 = \cancel{x_p - x} \quad x - x_p$$

$$y = mx + c$$

$$x = \frac{1}{m}\left[(y_p + 1) - c\right] \qquad \frac{y}{m} - c = x$$

$$d = d_1 - d_2 = x_p + 1 - x - x + x_p$$

$$d = 2x_p - 2x + 1$$

$$d = 2x_p - 2\left[\frac{1}{m}\left[(y_p + 1) - c\right]\right] + 1$$

$$d \cdot \Delta y = 2x_p \Delta y - 2\left[(y_p + 1)\Delta x - c\Delta x + \Delta y\right]$$

$$d = 2x_p \Delta y - 2y_p \Delta x + \left[-2\Delta x + 2c\Delta x + \Delta y\right]$$

$$\boxed{d = 2x_p \Delta y - 2y_p \Delta x + C}$$

if $d < 0$

selection is NE

$$d_{new} = 2(x_p + 1)\Delta y - 2(y_p + 1)\Delta x + C$$

$$\boxed{\Delta NE = d_{new} - d = 2(\Delta y - \Delta x)}$$

else

selection is (N)

$$d_{new} = 2x_p \Delta y - 2(y_p + 1)\Delta x + C$$

$$\boxed{\Delta N = d_{new} - d = -2\Delta x}$$

<u>For d_{in}:</u>

$$d\Delta y = 2x_p \Delta y - 2y_p \Delta x - 2\Delta x + 2c\Delta y + \Delta y$$

$$d = 2[x_p - y_p]$$

Calculate d_{in}.

16/01/2018

CIRCLE: $(x^2+y^2=R^2)$

CLOCKWISE

$$d_P = |OP^2 - OX^2|$$

$$d_P = |(x^2+y^2) - R^2|$$

measurable qty for a circle.

$$d_H = |(x_i+1)^2 + y_i^2 - R^2|$$

$$d_D = |(x_i+1)^2 + (y_i-1)^2 - R^2|$$

$$d_V = |x_i^2 + (y_i-1)^2 - R^2|$$

Diagonal (D) is reference which keeps on changing with every pixel selection.
ΔD_{i+1} is the differential (difference) in the change in D

Case (1):

$$OD^2 - R^2 < 0 \Rightarrow OD^2 < R^2$$

Case (2):

$$OD^2 - R^2 > 0 \Rightarrow OD^2 > R^2$$

Part I : Selection b/w H and D

$$\delta_{HD} = d_H - d_D = |OH^2 - R^2| - |OD^2 - R^2|$$

$$= |(x_i+1)^2 + y_i^2 - R^2| -$$

Bresenhem's Approach

Circle (with 1st quadrant):

$(x^2 + y^2 = R^2)$

1st octant : major movement in x.

1st derivative:

For column position $(x_i + 1)$:

$$d_1 = y_p^2 - y^2 \quad (\text{w.r.t } E)$$

$$d_2 = y^2 - (y_p - 1)^2 \quad (\text{w.r.t. } SE)$$

$$y^2 = R^2 - (x_p + 1)^2$$

$D = d_1 - d_2$ ⟶ Taking diff. in measurable qty.

$$D = y_p^2 - y^2 - y^2 + (y_p - 1)^2$$

$$D = y_p^2 - 2y^2 + y_p^2 + 1 - 2y_p$$

$$D = 2y_p^2 - 2y^2 - 2y_p + 1$$

$$\boxed{D = 2y_p^2 - 2(R^2 - (x_p+1)^2) - 2y_p + 1}$$

If $D < 0$

Selection is (E)

$$x_{p+1} \rightarrow x_p + 1$$

$$y_{p+1} \rightarrow y_p$$

$$D_{new} = 2y_p^2 - 2(R^2 - (x_p+2)^2) - 2y_p + 1$$

$$\cancel{D_{new} = 2y_p^2 - 2R^2}$$

$$\Delta E = D_{new} - D = 2(R^2 - (x_p+2)^2) - 2(R^2 - (x_p+1)^2)$$

$$\Delta E = 2\left[\cancel{R^2} - (x_p+2)^2 - \cancel{R^2} + (x_p+1)^2\right]$$

$$\Delta E = 2\left[-3 - 2x_p\right] = -2\left[3 + 2x_p\right]$$

$$\boxed{\Delta E = 2\left[2x_p + 3\right]}$$

else if $D \geq 0$
selection is (SE)

$$x_{p+1} \rightarrow x_p + 1$$
$$y_{p+1} \rightarrow y_p - 1$$

$$D_{new} = 2(y_p - 1)^2 - 2(R^2 - (x_p + 2)^2) - 2(y_p - 1) + 1$$

$$\Delta SE = D_{new} - D$$

$$\boxed{\Delta SE = 2(2x_p + 3) - 4(y_p - 1)}$$

<u>For D_{in}</u> :

$$D_{(0,R)} = 2R^2 - 2(R^2 - 1) - 2R + 1$$

$$\boxed{D_{in} = 3 - 2R}$$

2nd Derivative:

$$\Delta E = 2(2x_p+3)$$
$$\Delta SE = 2(2x_p+3) - 4(y_p-1)$$

(P,R)

$\rightarrow \Delta E^i = 6$

$\rightarrow \Delta SE^i = 10 - 4R$

if $D<0$
selection is E

$$x_{p+1} \rightarrow x_p+1$$
$$y_{p+1} \rightarrow y_p$$

$$\Delta E_{new} = 2(2x_p+5)$$
$$\Delta SE_{new} = 2(2x_p+5) - 4(y_p-1)$$

$$\Delta^2 E_E = \Delta E_{new} - \Delta E$$

$$\boxed{\Delta^2 E_E = 4}$$

$$\boxed{\Delta^2 SE_E = \Delta SE_{new} - \Delta SE = 4}$$

if $D > 0$

selection is SE

$x_{p+1} \rightarrow x_p + 1$

$y_{p-1} \rightarrow y_p - 1$

$\Delta E_{new} = 2(2x_p + 5)$

$\Delta SE_{new} = 2(2x_p + 5) - 4(y_p - 2)$

$$\boxed{\Delta^2 E_{SE} = \Delta E_{new} - \Delta E = 4}$$

$$\boxed{\Delta^2 SE_{SE} = \Delta SE_{new} - \Delta SE = 8}$$

Ellipse: $(b^2x^2 + a^2y^2 = a^2b^2)$

Region I: (major movement in x)

$$d_1 = a^2y_p^2 - a^2y^2$$
$$d_2 = a^2y^2 - a^2(y_p - 1)^2$$

$$a^2y^2 = a^2b^2 - b^2(x_p + 1)^2$$

$$D^{\boxed{I}} = d_1 - d_2$$

$$D^{\boxed{I}} = -2a^2y^2 + 2a^2y_p^2 - a^2 + 2y_pa^2$$

$$D^{\boxed{I}} = 2a^2y_p^2 + 2y_pa^2 - a^2$$
$$- 2(a^2b^2 - b^2(x_p+1)^2)$$

$$\cancel{D^{\boxed{I}} = a^2(2y_p^2 + 2y_p}$$

$$D^{\boxed{I}} = 2a^2y_p^2 - 2a^2y^2 + 2y_pa^2 - a^2$$

if $D < 0$

selection is E

$$D^{I}_{new} = 2a^2 y_p^2 - 2a^2 y^2 + 2y_p a^2 - a^2$$

$$D^{I}_{new} = 2a^2 y_p^2 - 2\left[a^2 b^2 - b^2 (x_p + 2)^2\right] + 2y_p a^2 - a^2$$

$$\Delta E^{I} = D^{I}_{new} - D^{I}$$

$$\Delta E^{I} = -2\left[a^2 b^2 - b^2 (x_p + 2)^2\right] + 2\left[a^2 b^2 - b^2 (x_p + 1)^2\right]$$

$$\Delta E^{I} = 2b^2 (x_p + 2)^2 - 2b^2 (x_p + 1)^2$$

$$\Delta E^{I} = 2b^2 (\cancel{x_p^2} + 4 + 4x_p - \cancel{x_p^2} - 2x_p - 1)$$

$$\boxed{\Delta E^{I} = 2b^2 (3 + 2x_p)}$$

else if $D >= 0$

selection is SE

$$D^{\boxed{I}}_{new} = 2a^2y_p^2 - 2a^2y^2 + 2y_pa^2 - a^2$$

$$D^{\boxed{I}}_{new} = 2a^2(y_p^2-1) - 2\left[a^2b^2 - b^2(x_p+2)^2\right] + 2(y_p-1)a^2 - a^2$$

$$\Delta SE^{\boxed{I}} = D^{\boxed{I}}_{new} - D^{\boxed{I}}$$

$$\Delta SE^{\boxed{I}} = 4a^2y_p^2 - 2\left[a^2b^2 - b^2(x_p+2)^2\right] + 2\left[a^2b^2 - b^2(x_p+1)^2\right]$$

$$\Delta SE^{\boxed{I}} = 2b^2\left[(x_p+2)^2 - (x_p+1)^2\right] + 4a^2y_p^2$$

$$\boxed{\Delta SE^{\boxed{I}} = 2b^2\left[3 + 2x_p\right] + \boxed{4a^2y_p^2}}$$

<u>For $D_{in}^{\boxed{I}}$:</u>

<u>Starting from $(0,b)$:</u>

$$D_{in}^{\boxed{I}} = 2a^2b^2 + 2ba^2 - a^2 - 2(a^2b^2 - b^2)$$

$$\Rightarrow \boxed{D_{in}^{\boxed{I}} = 2ba^2 - a^2 + 2b^2}$$

Cyrus – Beck Method:

Parametric eqn: $P(t) = P_1 + (P_2 - P_1)t$ —— ①

Drop a vector from an edge & let it swing like a pendulum.

$$\vec{v} = [P(t) - P(E_i)]$$

$$\vec{v} \cdot \vec{N_i} \begin{cases} < 0 \\ = 0 \\ > 0 \end{cases}$$

$$\vec{v} \cdot \vec{N_i} = 0$$

$$[P(t) - P(E_i)] \cdot \vec{N_i} = 0$$

$$[P_1 + (P_2 - P_1)t - P_{E_i}] \cdot \vec{N_i} = 0$$

$$N_i \cdot (P_1 - P_{E_i}) + \vec{N_i} \cdot (P_2 - P_1)t = 0$$

$$\boxed{t = \frac{N_i \cdot (P_1 - P_{E_i})}{-N_i \cdot (P_2 - P_1)}}$$

Left Edge :

$N_i = -i$

$P_1 = 2\hat{i} + \hat{j}$

$P_2 = 3\hat{i} + 3\hat{j}$

$P_{E_i} = 4\hat{j}$

$t = 2/5 \longrightarrow$ Put it in eqn ① to get the intersection pt

$-N_i \cdot (P_2 - P_1)$
- $\neq 0$
- < 0 — is potentially exiting
- > 0 — is potentially entering

If $\boxed{0 \leq t \leq 1}$

→ then only we have to find the intersection pt

Otherwise, the edge & the line ~~are~~ do not intersect. So, there is no need to find the intersection pt.

Example 1:

Left Edge:

$N_i = -i$

$P_{E_i} = (1,8) = i + 8j$

$P_1 = -2i - 2j$

$P_2 = 11\hat{i} + 7\hat{j}$

$$t_L = \frac{-i \cdot (-2\hat{i} - 2\hat{j} - i - 8j)}{+i \cdot (11\hat{i} + 7\hat{j} + 2\hat{i} + 2j)}$$

$$t_L = \frac{-i(-3\hat{i} - 10\hat{j})}{i(13\hat{i} + 9\hat{j})}$$

$$t_L = \frac{3 + 0}{13 + 0} = \boxed{\frac{3}{13}}$$

Bottom Edge:

$N_i = -j$

$P_{E_i} = 8i + 3\hat{j}$

$P_1 = -2\hat{i} - 2j$

$P_2 = 11\hat{i} + 7\hat{j}$

$$t_B = \frac{-\hat{j}\cdot(-10\hat{i} - 5\hat{j})}{-\hat{j}\cdot(13\hat{i} + 9\hat{j})}$$

$$\boxed{t_B = 5/9}$$

Right Edge:

$N_i = +\hat{i}$

$P_{E_i} = 8\hat{i} + 8\hat{j}$, $P_1 = -2\hat{i} - 2\hat{j}$, $P_2 = 11\hat{i} + 7\hat{j}$

$$t_R = \frac{\hat{i}(-10\hat{i} - 10\hat{j})}{-\hat{i}(13\hat{i} + 9\hat{j})}$$

$$t_R = \frac{-10}{-13} = \boxed{\frac{10}{13}}$$

Up Edge:

$N_i = +\hat{j}$

$P_{E_i} = 8\hat{i} + 8\hat{j}$, $P_1 = -2\hat{i} - 2\hat{j}$, $P_2 = 11\hat{i} + 7\hat{j}$

$$t_T = \frac{\hat{j}(-10\hat{i} - 10\hat{j})}{-\hat{j}(13\hat{i} + 9\hat{j})} = \frac{-10}{-9} = \boxed{10/9}$$

		Denominator values	
t_L	$= 3/13$	> 0	Max of those two
t_B	$= 5/9$	> 0	
t_R	$= 10/13$	< 0	
t_T	$= 10/9$	< 0	Neglected since $t > 1$.

(Left, Right, Top, Bottom)

Part III :
End point is on the corner.

Step 2:

Part I :

If line $(P_1 - P_2)$ is rotated, then its slope m will between any of the slopes m_1, m_2, m_3, m_4.

```
if ( (m > m2) && (m < m1) && (P1.x1 > P2.x2) )
{
    if (P2.x2 < xw_min)
        clipping

    ~~No cli~~
}
```

// Similarly for other cases.

Part II:

// Similarly for other cases.

Part III:

P1 in lower part of y=x

P1 above y=x.

// Similarly for other cases.
